Shield™ is a qualitative laboratory developed test intended to detect colorectal neoplasia by identifying genomic and epigenetic alterations in cell-free DNA in plasma from blood collected in Guardant blood collection tubes.

- The assay is intended to be complementary to and not a replacement for current recommended colorectal cancer screening methods
- Patients with an “abnormal signal detected” Shield test result should be referred for colonoscopic evaluation
- A “normal signal detected” Shield test result does not preclude the presence of colorectal neoplasia, and patients should continue participating in guideline-recommended screening programs
- Shield was developed, and its performance characteristics determined, by the Guardant Health Clinical Laboratory in Redwood City, CA, USA, which is certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA) as qualified to perform high complexity clinical testing. This test has not been cleared or approved by the US FDA
